CS110 / INDEPENDENCE ROAD

pitch / Nicolas Uribe

Issued: Nov 10, 2026, 2:56 PM Pacific

Record: FORM-BD8F9707793900182DD32724

Personal public verification code: VIEW-57A8237D0C4986D619F76DCD

Include your own public code with every assignment, even in a team folder. Never submit your private recovery key.

SHA-256: 99138395a7894c789b48a3bcdf067775722894583a3b5044ae3fb76cc8826111

Verify the record number at courses.addp2p.com/development-road/independence/index.html?view=verify

An issued record preserves submitted information. It is not a grade or proof of comprehension.

What do you understand about the work and finish line?

Observation / Summary:

The core work involves executing a full mini game development pipeline progressing systematically from developer mindset and JSON-automated project directory creation to living GDD documentation and importing character assets into Unity.

Useful Idea / The Work & Finish Line:

The "work" is maintaining disciplined organization, clear communication, and adaptable problem-solving throughout production. The "finish line" is reached when a fully configured character model and game concept are successfully integrated, documented, and playable inside the engine without technical debt or broken references.

Question:

What criteria will we use during our final quality assurance check to confirm the character and engine setup are completely ready for full-scale development?

What will you contribute? Name a task or useful capability.

Observation / Summary:

Completed the mini game development pipeline modules covering mindset management, JSON-driven project directory setup, GDD documentation, and custom character import workflows in Unity.

Useful Capability / Task Contribution:

I bring the capability to set up and manage standardized project architectures specifically utilizing automated JSON folder generation scripts, timestamped project logs, and living Game Design Document (GDD) templates to prevent scope creep and streamline collaboration.

Question:

How should we divide these pipeline setup and documentation responsibilities among team members for our upcoming collaborative project?

What needs research, support or practice?

Observation / Summary:Reviewed the complete game development mini-pipeline workflow, spanning developer mindset, automated JSON project folder setup, living GDD documentation, and custom character asset imports in Unity.What Needs Research, Support, or Practice:

I need more hands-on practice writing and customizing JSON configuration files for automated directory generation,

as well as deeper technical research into configuring advanced character rigging, materials, and movement scripts inside Unity. Question:

What resources or tutorials can we utilize to practice setting up advanced character animation controllers and script rigging within our Unity project structure?

Your available work times and preferred contact method: Discord, email, text, classroom or other. Keep private addresses/numbers outside public exports.

Preferred contact: Text

List your project tools and why you need them.

Established a complete game development mini-pipeline workflow, spanning mindset training, JSON-automated project directory setups, living GDD documentation, and character imports in Unity. Project Tools & Purpose:JSON Project Directory Generator: Used to automatically build out standardized folder hierarchies and template files instantly, ensuring efficient project structuring and asset organization. Unity Game Engine: Used as the core development environment to house scenes, configure materials, import custom player models, and compile the game. Notepad++ / Text Documents: Used for maintaining continuous, timestamped project logs and tracking iterative updates. Game Design Document (GDD) Templates: Used as the single source of truth to outline core gameplay loops, backstories, and scope constraints. Question:Are there any additional tools or version control plugins we should integrate into our workflow to further streamline team collaboration?

Required: name the AI you will use, its project task and how you will verify its output. Use course-provided/shared or approved local access if needed; no personal or paid AI account is required.

AI: ChatGpt

Task: give me idea and help with stuck situations.

Verification: by describing or showing its contribute when using AI.
